

Monkeypox Diagnostic Report

Report Generated on: 2024-10-26 19:17:35

Dear sfd, based on the analysis:

Predicted Class: Monkeypox

Your Skin

Focused Area (Heatmap)

Explanation of Heatmap

The heatmap highlights specific areas of the skin lesion that the model identified as critical in diagnosing Monkeypox. The red and yellow regions indicate the parts of the image that were most important in the model's decision. These areas may correspond to characteristic Monkeypox features such as blistering, ulceration, or specific lesion patterns.

Next Steps

Based on the prediction, it is advised to consult with a healthcare professional immediately for further testing and confirmation. Until you receive professional advice, try to limit contact with others to avoid potential transmission of the virus. Monitor symptoms like fever, swollen lymph nodes, or

additional skin lesions. Testing for Monkeypox-specific antigens may be required.
